

ABSTRACT

An improved handheld electronic device and an improved method facilitate the entry of data when the data is to be of a particular arrangement of alphabetic (A) and/or numeric (N) and/or other characters. In the depicted exemplary embodiment, the handheld electronic

5 device includes a user interface that facilitates the entry of postal codes, zip codes, and the like that vary from country to country by processing key inputs according to a data format that has been selected on the basis of its correspondence with a country. In the example of address data, the handheld electronic device detects the entry of country-specific data, such as the name of the country or one of its geographic regions, and selects a corresponding data

10 format for processing keystrokes during entry of postal codes, zip codes, or other codes.
